medMindcare™ Product Brief

electronic medical record & mental health information system

medMindcare is a specialized clinical encounter and care-plan system that is designed to provide a reliable and function-rich information system that helps providers efficiently assess and treat patients. The system documents' all types of clinical encounters, provides for orders, and integrates different information into a central secure patient record. The system is designed to integrate and work with other applications at a single facility or in a distributed clinical setting.

medMindcare complements the natural work-flow in a mental healthcare environment. It is a provider-designed application suite design based on advanced computer medical informatics. The system utilizes the same look-and-feel integrated design as medEncounter™ with advanced windows-style mouse point-and-click operations within a browser-based user interface. medMindcare utilizes medAnalyze™ and medDataSafe™ for decision support and data base operations. medEncounter is a clinical information system based on a suite of applications (including medMindcare and medAnalyze) for medical settings.

"It's an elegant system with down to earth capabilities for mental health."
Eric Nelson, MD
Medical Director
Georgia Regional Hospital,
Atlanta, Georgia

medMindcare Key Concepts

- Customized patient encounter forms and care summaries
- Lifetime clinical record (with multiple views including SOAP, Problem List, time-oriented etc.)
- Accreditation support (JCAHO, HCFA-CMS, CARF, HIPAA) including electronic signatures
- Supports Total Quality Improvement (TQM)
- Medication ordering with active drug allergy notices and optional pharmacy system
- Professional billing management and interfaces
- Clinical messaging (secure email) can be appended to patient records
- Resource/appointment scheduling
- Single, common point-of-entry for all applications

- Windows-style mouse operation with pop-up windows and pull-down menus
- Standard Internet Explorer / Netscape Navigator browser-based user interface
- "Patient-safe" decision support and outcome analysis with English-language inquiries and research

medMindcare is fully integrated with the database management system (medMindcare) and uses medMindcare's integrated decision support system (medAnalyze) as well as other applications and utilities.

Key Benefits

- Helps improve medical decisions and reduces errors through more complete, timely and integrated information
- Increases productivity and reduces cost - see more patients through greater efficiency & minimize paper handling
- Improves billing accuracy and provides better documentation for insurance/legal requirements
- Embedded rules and protocols aid quality, consistency
- Aids management with powerful decision support tools
